* No pure atmospheres possible

expl.: Can create explosive atmospheres: Any measurements under such conditions are done on the customers risk. NETZSCH takes over no warranty or responsibility for such measurements.

** Special instrument design (modifications) necessary/recommended

(This document contains a summary of different literature sources. No warranty can be taken over.)

H₂ and Hydrocarbons:

Humidity: Reaction with Platinum above ~600°C (W/Re sensors necessary)

Only use inert gas saturated with water vapor, reaction with Graphite above ~1500°C

Carbon dioxide (CO₂): Considerable dissociation above ~800°C

Toxic, reaction with Platinum above ~600°C (W/Re sensors necessary)

Carbonmonoxide (CO): Toxic, dissociation above ~400°C, reaction with Platinum above ~600°C

Hydrogen sulphide (H₂S): Toxic, reactions with Platinum, Alumina and Graphite

Chlorine, Fluorine (Cl₂, F₂): Very toxic, reactions with Platinum, Alumina and Graphite

Hydrochloric acid (HCl): Toxic, reactions with Platinum and Alumina at elevated temperatures

Sulphur dioxide (SO₂): Toxic, never use together with humidity

Ammonia (NH₃): Dissociation above 400°C in the presence of Platinum, reaction with Platinum above ~600°C

Nitrogen oxides (NO_x): Toxic, not use with flammable or explosive gases (forms explosive mixtures)

Gas mixtures: Humidity shall never be mixed with corrosive atmospheres
